### 技术规格

<b>Background:</b>	The protein encoded by this gene is highly similar to the gene product of <i>Schizosaccharomyces pombe rad21</i> , a gene involved in the repair of DNA double-strand breaks, as well as in chromatid cohesion during mitosis. This protein is a nuclear phospho-protein, which becomes hyperphosphorylated in cell cycle M phase. The highly regulated association of this protein with mitotic chromatin specifically at the centromere region suggests its role in sister chromatid cohesion in mitotic cells.
